

SIGNS AND SYMPTOMS OF A CRACKED TOOTH

- Sensitivity to Cold food and drinks
- Hurts when you bite down
- Visual crack on the tooth
- Pain that comes and goes when chewing or eating certain foods.

Why You May Need a Crown To Protect Your Tooth!

A dental crown may be needed in the following situations:

1. To protect a weak tooth (for instance, from decay) from breaking.
2. To Protect an already cracked tooth (if can be saved).
3. To restore an already broken tooth or a tooth that has been severely worn down (maybe due to grinding).
4. To restore or save a tooth that has an old amalgam (silver) filling that is leaking or is broken.
5. Tooth has had a root canal and needs to be protected to avoid breaking.

WHY YOU SHOULDN'T WAIT...

Leaving tooth decay untreated only leads to further dental problems in the future.

A structurally weak tooth can potentially crack, or even shatter, without a crown to cap it.

Waiting to get a crown after root canal therapy can lead to the loss of your tooth.

Getting a dental crown now can save you from dental bridges or implants in the future.

Promptly taking care of dental treatments, like crowns, saves you time and money in the long run.
